

Here is the discussion forum dedicated to "streaming multimedia content". You are welcome to post comments and share your creations here, and of course ask questions.

Let us suggest some topics of discussion and optional projects:

SUGGESTED TOPICS

- Where do you host your video files (we are speaking about files that can be used with the `<video>` element directly, not on YouTube, DailyMotion, etc.)?
- Did you already try some of the enhanced audio or video players? Can you share opinions or make a review?
- What tool do you use for encoding your audio and video files?

OPTIONAL PROJECTS

Here are a few ideas to play with the material learnt in this section. Your classmates and the team who prepared the course will be happy to try them and give some feedback. Please do post URLs of your works in this discussion forum. These projects are optional, meaning that they won't be graded.

Project 1 (very easy): try to find the "enhanced HTML5 video players" described in the course and try to use one of them to play a video + use some of the possible customizations: add a logo, choose a theme, etc.

Project 2 (easy): try to write a video or an audio player with some custom buttons for play/stop/etc. Add to your custom player a mean to play several videos one after another - what we call a playlist -, etc.

Project 3 (with JavaScript knowledge): try to play a video file or an audio file with an external synchronization. Use the `progress` event and the `currentTime` property from the audio and video objects you can manipulate with the JavaScript API described in the course. For example, please display some text aside the video, and/or display a wikipedia page in an `iframe`, and/or display a google map if you know how to do it.
